# 1 Template

**Table 1:** Anti-Aliasing Filter Specifications and Achieved Performance

Specification	Target	2 <sup>nd</sup> -Order Butterworth	3 <sup>rd</sup> -Order Butterworth
Pass-band ripple $A_{\max}$ (dB)	$\leq 0.5$	0.5	0.5
Stop-band attenuation $A_{\min}$ (dB)	$\geq 80$	90	90
Pass-band edge $f_p$ (kHz)	20	20	20
Stop-band edge $f'_s$ (MHz) <sup>1</sup>	4.62	4.62	4.62
Transition ratio $f'_s/f_p$	231	231	231
Filter order $N$	—	2 (chosen)	3 (strict)
Theoretical in-band group delay <sup>2</sup> ( $\mu$ s)	—	7.9	11.8

**Figure 1:** Logo da Nova FCT

$$\begin{cases} R(283, 15) = 1,998 \cdot 10^4 \Omega \\ R(298, 15) = 10^4 \Omega \\ R(313, 15) = 0,5282 \cdot 10^4 \Omega \end{cases} \Leftrightarrow \begin{cases} A = 1,3092 \cdot 10^{-3} \\ B = 2,1439 \cdot 10^{-4} \\ C = 9,6600 \cdot 10^{-8} \end{cases} \quad (1)$$

**Listing 1:** Matlab code example

```
Fdz
printf('Polos: \n');
PlFdz
%figure(3);
pzmap(Fdz);
%figure(4);
step(Fdz);
```

<sup>1</sup>First stop-band edge equals  $f_s - f_p$ , where  $f_s$  is the modulator sampling frequency (4.64 MHz).

<sup>2</sup>Approximate group delay evaluated at  $\omega_p$  for a Butterworth LPF:  $\tau_g \approx N/(2\pi f_p)$ .

- item 1
- ...
- item n

1. Butterworth
2. Chebyshev
3. Elliptic
4. Bessel

In the application in study, the group delay is a critical factor because the ECG signal is a time-domain signal, and the phase distortion can lead to a misinterpretation of the signal. So it is safe to say that the Bessel filter is the best choice for this application.
